Keep your passengers safe!

**With The SAFE-X-IT
Door Restrictor**

While elevators remain one of the safest forms of transportation, we all need to do our part to ensure that passengers riding elevators are as safe as they can be. This is where the SAFE-X-IT Door Restrictor comes into play. In 2006 there have been at least four deaths directly related to elevators that did not have some type of door restrictor device installed.

You might wonder, "What the heck is a door restrictor". I'll be happy to explain. Door restrictors keep elevator passengers safe by locking the doors when the elevator car is outside the unlocking zone (18" above and below the landing). This device prevents passengers from attempting to escape from an elevator car that has stopped between landings.

How can someone die by trying to escape from a stuck elevator? When an elevator shuts down or faults there's a good chance that it will stop between floors. Depending on the circumstances, the trapped passenger sometimes is able to pry open both elevator and hoistway doors. Once both doors are opened the passenger attempts to get out. In cases where the elevator floor is much higher than the landing floor the following happens. As they jump or lower themselves down to the floor landing, they lose their balance and fall into the opening under the elevator car and down into the hoistway. If you are ever stuck in an elevator, the best thing to do is stay put and call for help by pressing the Alarm Button or by calling out on the Emergency Telephone.

The SAFE-X-IT door restrictor is easy to install and provides peace of mind. It will work on any power or manually operated elevator door, no matter how old the unit is. As long as it's installed correctly and checked for proper operation during monthly maintenance visits it can help save a life.

Helping You One Floor At A Time...Since 1910!

Elevator Shutdowns...

are going to happen! If there's a problem with an elevator it's designed to stop. Remind passengers that the safest place for them is inside the elevator. Let them know that they should press the alarm button and call out on the telephone for assistance.

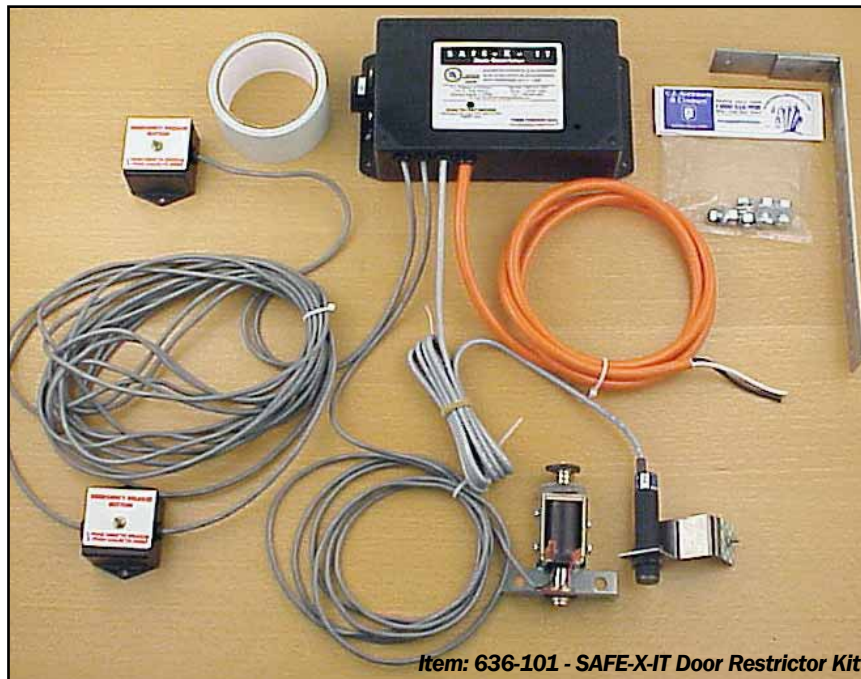

Tough Enough...

to keep even the most determined elevator passenger safe. The door solenoid device and door bracket prevent the elevator doors from opening while in the elevator and out of the unlocking zone.

SAFE-X-IT Kit

Each Unit Features:
2 Emergency Release Buttons, Control Box, Infrared Light Beam, Reflector Tape, Door Bracket.

While not required by code the SAFE-X-IT also features a Fire Service Override Contact. This makes the unit inoperable when Firefighters have commandeered the elevator. Please note that this feature must be wired to the Phase II Key Switch in order for it to function.

Easy To Install

With everything prewired, installation is a breeze. Simply mount everything as shown according to the installation instructions and connect the 110 power supply.
